A and B Series Sensors for Humidity and Temperature

for industrial applications from -80...200°C and up to 25 bar

Description of the Sensor

The sensors of the A and B series with **integrated hx processor** measure humidity by means of a humidity-dependant condenser. The capacitive Mela® humidity measuring element, produced using thinfilm technology, consists of a base plate, on which the electrodes are housed and a hygroscopic polymer layer above it. The hygroscopic polymer layer absorbs water molecules from the medium to be measured (air) or releases them, thereby altering the capacity of the condenser.

The transmitters with the hx processor use the values of the relative humidity and the temperature to calculate the dew point temperature, the enthalpy, the mixing ratio, the absolute humidity or the wet-bulb temperature, in accordance with the laws of physics²⁾. The values are emitted at two analogue outputs with the standardised signals 0....1VDC or 010VDC or 420mA. The outputs can be configured differently and are defined using the software. Further measuring ranges on request.

The sensor parts and transmitters of the B series are firmly connected. In addition, the installation of a passive temperature element is possible (e.g. Pt100). All further technical features correspond to the ones of the A series.

The scope of delivery includes the sintered high-grade steel filter ZE13. If a better dynamics should be required, we recommend to use the filter type ZE04 together with a PTFE filter which protects the humidity sensing element directly. We recommend to do so in particular at low air speeds and also its increased service life, even under more challenging operating conditions (pollutant impact or permanent humidity > 95 %rh). The use of different filters is not possible. The sensors are designed for unpressurised systems (except the ...HD... version), the measurement medium is nonaggressive air.

Please consult "application instructions for the sensing elements" (product info sheet no. A 1) or check with the manufacturer for further information which you need to bear in mind when using humidity sensors with capacitive sensing elements.

2) The accuracy of the calculated values depends on both the operating point in accordance with the hx diagram and on the primary values measured.

Galltec+Mela® sensors in the A series combine the digital measured value processing with the advantages of our robust industrial sensors which can be used at temperatures up to -80...200°C resp. at pressures up to 25 bar and are ideally suited for demanding industrial applications.

The A series with exchangeable sensor part consist of a calibrated sensor part with 4-pin plug and a transmitter with analog output. Sensor part and transmitter can be combined and matched with each other, according to the physical and mechanical requirements.

The measured humidity and temperature values are calculated in the calibrated sensor part with the calibration values stored there, and are passed on as digital measurement values. The sensor parts are either firmly connected to the transmitter or are exchangeable via plug-in connection and can be readjusted on site using buttons and LED. They can also be factory-calibrated and readjusted using software.

Technical Data for Humidity and Temperature

Humidity

measuring range 0	100%rh
measuring accuracy *1090%rh at 23°C	±1.5%rh
at <10%rh or >90%rh	±2%rh
influence of temperature (TK) ±0).02%rh/K
hysteresis	< 1%rh
response time t ₆₃ at v=2m/s	< 10 s

^{*)} ex works. Depending on the specific range of application a regular recalibration of the sensor parts has to be effected. Higher accuracies on request.

Temperature

measuring element	Pt1000 cl.B
•	see table page 3
measuring accuracy at 23°C *)	±0,15K
influence of temperature (TK)	<0.005 K/K

 $[\]ensuremath{^{^{\circ}}}\xspace$ depending on the (extension) of the output range , max. 0,25 K

Options

Digital display

ZE33	as designation	F5.2	Adapter for humidity standard ZE 31/1

User instructions

Installation

The sensors are to be attached in a position representative for the climate measurement.

The position the sensor is mounted in (horizontal, vertical) does not matter. However, it should be mounted in such a way that no water can get into it.

Please note the maximum permissible ambient temperature for the sensor and transmitter when installing it. The transmitters always have to be installed in such a way that the connection plugs are not exposed to a higher temperature either (>85°C).

The duct sensor SVKA.0E... is mounted with an insulation length of at least 134 mm for use at 150°C (refer to dimension drawing).

The tightening torque when installing the pressure-resistant sensors (type SZKA.HD...) may not exceed 25 Nm.

In order to maintain interference immunity in accordance with EN 61326 when it is in use, we recommend to use a screened cable (e.g. **type 8x AWG26 C UL order no. 5339**) for connecting the sensors, and have this fitted into the sensor's EMC heavy-gauge conduit thread by a qualified electrician.

In a clean environment, the sensor is maintenance-free.

The protective filters should only be screwed off carefully to check functioning with the humidity standard. It is important not to touch the highly sensitive sensor element in the process. If necessary, soiled filters can be screwed off and rinsed. When you

screw them back on, bear in mind that sensors will not measure accurately again until they are completely dry. Sensors with integrated PTFE filter be completely and carefully cleaned with distilled water. It is not possible to exchange the PTFE filter on the humidity sensor element. Dust does not cause any harm to the humidity sensor, however, if there is an increased build-up of dust this does affect dynamic performance.

Dew formation and splashes do not damage the sensor, although corrupted measurement readings are recorded until all the moisture on and directly around the sensor element has dried up.

Damaging Influences

Agents that are corrosive and contain solvents, depending upon the type and concentration of the agent, can result in faulty measurements and cause the measuring element to break down. Substances deposited on the sensor are damaging as they form a water-repellent film (this applies to all humidity sensors with hygroscopic measuring elements); e.g. resin aerosols, lacquer aerosols, smoke deposits etc.

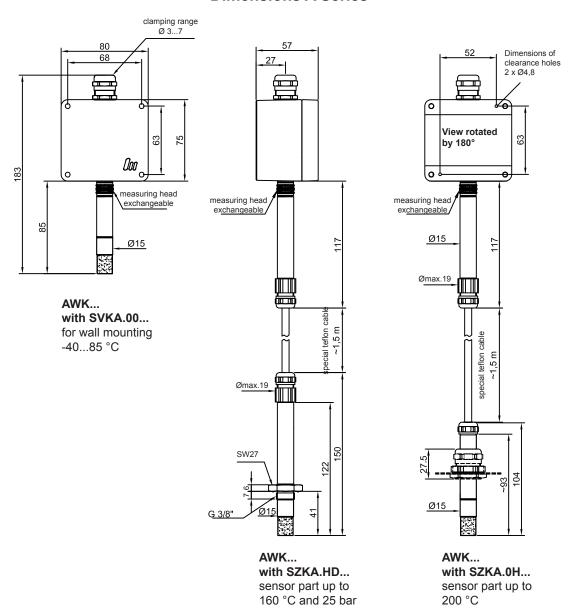

In order to check functioning in the place of installation, we recommend that you use our *ZE31/1*-type *humidity standard...* (accessories).

To ensure the given accuracy of the sensors, we recommend a calibration cycle of 6-12 months.

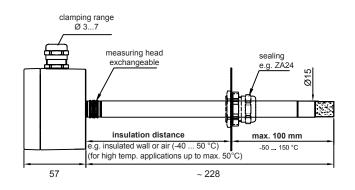

Additional information

Please consult "application instructions for the sensing elements" (product info sheet no. A 1 and B1.1), which you can get from www.galltec-mela.de, for further information which you need to bear in mind when using humidity sensors with capacitive sensing elements.

User instructions for in situ alignment via internal keypad and LED

Humidity adjustment

1-point-adjustment (Offset)

Selection of calibration mode

press button DOWN for at least 3 sec. LED lights up 1 time

1-Point-adjustment humidity mode is reached

Confirmation: press button DOWN for at least 3 sec.

LED lights up permanently

For modifying of adjustment value press buttons UP / DOWN: + / - 0.1 %rh

Confirmation: press button DOWN for at least 3 sec.

The adjustment value is saved.

Termination of adjustment mode at any time: press button UP for at least 3 sec.

Humidity adjustment

2-point-adjustment (lower point, 33 %rh) see accessories ZE 31/1-33

Selection of calibration mode

press button DOWN for at least 3 sec. LED lights up 1 time press button DOWN 1 time shortly LED lights up 2 times

2-point-adjustment 33% humidity mode is reached

Confirmation: press button DOWN for at least 3 sec.

LED lights up permanently

For modifying of adjustment value press buttons UP / DOWN: + / - 0.1 %rh

Confirmation: press button DOWN for at least 3 sec.

The adjustment value is saved.

Termination of adjustment mode at any time: press button UP for at least 3 sec.

Humidity adjustment

2-point-adjustment (upper point, 75 %rh) see accessories ZE 31/1-75

Selection of calibration mode

press button DOWN for at least 3 sec. LED lights up 1 time press button DOWN 2 times shortly LED lights up 3 times

2-point-adjustment 75% humidity mode is reached

Confirmation: press button DOWN for at least 3 sec.

LED lights up permanently

For modifying of adjustment value press buttons UP / DOWN: + / - 0.1 %rh

Confirmation: press button DOWN for at least 3 sec.

The adjustment value is saved.

Termination of adjustment mode at any time: press button UP for at least 3 sec.

Temperature adjustment	1-point-adjustment	ery good thermal coupling between the reference device and the measuring d are the precondition when doing temperature compensation.		
		Selection of calibration mode		
		press button DOWN for at least 3 sec.		
		LED lights up 1 time		
		press button DOWN 3 times shortly		
		LED lights up 4 times

		Termination of adjustment mode at any time: press button UP for at least 3 sec.		
Restore factory se	ettings	press buttons UP and DOWN simultaneously for more than 10 sec . All user adjustments will be reset.		

Mounting instructions

Position	The sensor has to be installed vertically with the measuring head downwards or horizontally. Do avoid positions where water ingress can occur.
	We recommend that you lay the connection lines in a loop so that any water that may be present can run off.
	Install the sensor at a place where characteristic levels of humidity occur. The sensor tube resp. measuring head should be exposed to the flow of air. Avoid installation next to heaters, doors or on outer walls. Avoid places exposed to the sun.
	Not reaching the given minimum air speed can lead to measurement errors
Connection	The electrical connection must be carried out by qualified personnel only.
	The sensor contains sensitive electrical components. When opening the housing, make sure you comply with the electrostatic discharge precautions (ESD).
	Pay attention to the load according to the operating voltage when using sensors with a current output.
	Lines to and from the sensor must not be installed parallel to strong electromagnetical fields.
	If there is any chance of an electrical surge, please install surge protection devices.

User instructions (see also page 3)

Dew formation	Dew formation and splashes do not damage the sensor, although measurement readings are corrupted until all moisture on and around the sensing element has dried up completely.
Cleaning of filters and protective baskets	If necessary, soiled filters and protective baskets can be screwed off and rinsed carefully. Bear in mind the sensors wil not measure accurately until filters are completely dry. Please do not touch the highly sensitive sensing element.
Cleaning of capacitive sensing element	Loose dust can be carefully cleaned off the humidity sensing element using distilled water or by blowing the dust carefully off. Please do not touch the highly sensitive humidity sensing element in the process.
Damaging influences	Depending on type and concentration, agents that are corrosive and contain solvents, can result in faulty measurements and can cause the sensor to break down. Substances deposited on the sensor (e. g. resin aerosols, lacuer aerosols, smoke deposits etc.) are damaging as they eventually form a water-repellent film.
